

ABSTRACT

A tool holding and displaying device includes a plate having a narrower neck portion formed between an upper orifice and a lower aperture. The upper orifice of the plate includes an inner diameter
5 greater than that of the lower aperture of the plate, and a bracket includes a latch having an enlarged head formed on a pin for engaging into the upper orifice of the plate. The enlarged head of the latch is greater than the lower apertures of the plate, to engage with the plate, and to anchor the bracket to the plate. The plate
10 includes one or more spring arms to engage with the pin of the latch of the bracket, to lock the latch of the bracket to the plate.
